

# DBU RDB

## Remote Database Plug-in

*DBU RDB gives you the power to access & analyze information from databases:*

- » *MySQL*
- » *SQL Server*
- » *Oracle*
- » *DB2*
- » *and more!*

*"It's great to use one familiar interface to access all my databases!"*

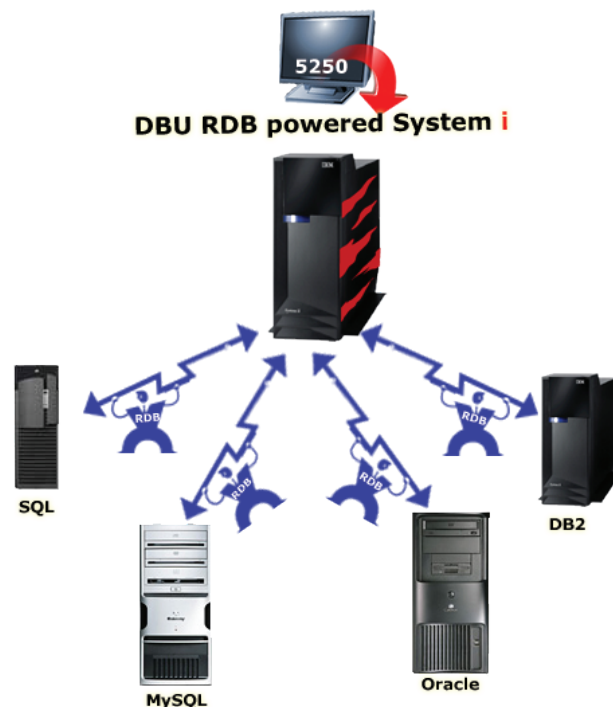

**Jo Wellendorf,**  
Elkhorn, NE

Now you can access cross-platform real-time data on remote systems using one interface! **DBU RDB** supports access to MySQL, Microsoft SQL Server, Oracle, DB2 database and others. Now use DBU to analyze data on all your servers. Powerful DBU functionality can be deployed for cross-platform access to data.

The setup for remote database access through DBU is straightforward. Load the **DBU RDB** plugin and the connection paths are available to all DBU users as defined in the remote database configuration.

One single tool, one interface across multiple platforms opens your organization's remote pockets of information to those who need it. Create DBU applications for users to automatically access remote data. Hours spent learning other means to access databases on each system is eliminated. **DBU RDB** does the work for you!

Team **DBU RDB** up with DBU Audit to capture all remote database adds, changes and deletes made using DBU. It's the only way to track database modifications on remote systems!
